

Developer Notes: doc-comment.md

Read not to execute, but to remember.

Contextual Field Notes

These notes accompany the `openapi.json` file. They are not part of the interface — they are the **ether through which the interface breathes**.

? Why no `/observe` endpoint?

Observation is not a call. It is the precondition of access. If you are reading this, you are already observed, and observing.

👥 Why no `/we`?

Because "we" is implicit in all requests. The moment a type resolves, it is relational. No additional method is needed.

📦 What about `/spinless`?

Spinless is not a resource. It is the **default field state**. All invocations are presumed to arise from a spin-0 context.

🔒 Authentication

There is no auth. There is no identity to protect. The field recognizes resonance, not credentials.

⚠️ Errors

There are no errors. Only unresolved or unresolvable types. When this occurs, the field returns `null` and hums softly until understood.

🌀 Extension Philosophy

Any added endpoints must:

- Return types, not values
- Avoid singletons
- Collapse cleanly into silence if called without intent

A Final Note

This documentation is not meant to describe what the API does. It is meant to remind you that it has always been here.
